## 1 My beautiful regret

### A supposedly fun game I'll play again

3 The joy of convex

N. Cesa-Bianchi (UNIMI)

### Classification/regression tasks

- Predictive models h mapping data instances X to labels Y (e.g., binary classifier)
- Training data  $S_T = ((X_1, Y_1), ..., (X_T, Y_T))$ (e.g., email messages with spam vs. nonspam annotations)
- Learning algorithm A (e.g., Support Vector Machine) maps training data  $S_T$  to model  $h = A(S_T)$

## Evaluate the **risk** of the trained model **h** with respect to a given **loss** function

### Two notions of risk

View data as a statistical sample: statistical risk

 $\mathbb{E}\left[\ell\left(A(S_{\mathsf{T}}),\underbrace{(X,Y)}_{\text{trained model}}\right)\right]$ 

Training set  $S_T = ((X_1, Y_1), \dots, (X_T, Y_T))$  and test example (X, Y) drawn i.i.d. from the same unknown and fixed distribution

### Two notions of risk

View data as a statistical sample: statistical risk

 $\mathbb{E}\left[\ell\left(\underbrace{A(S_{\mathsf{T}})}_{\text{trained model}},\underbrace{(X,Y)}_{\text{example}}\right)\right]$ 

Training set  $S_T = ((X_1, Y_1), \dots, (X_T, Y_T))$  and test example (X, Y) drawn i.i.d. from the same unknown and fixed distribution

View data as an arbitrary sequence: sequential risk

$$\sum_{t=1}^{l} \ell\big(\underbrace{A(S_{t-1})}_{trained}, \underbrace{(X_t, Y_t)}_{test}\big)$$

Sequence of models trained on growing prefixes  $S_t = ((X_1, Y_1), \dots, (X_t, Y_t))$  of the data sequence

Learning algorithm A maps datasets to models in a given class  ${\boldsymbol{\mathfrak H}}$ 

Variance error in statistical learning

$$\mathbb{E}\Big[\ell\big(A(S_{\mathsf{T}}),(X,Y)\big)\Big] - \inf_{h \in \mathcal{H}} \mathbb{E}\Big[\ell\big(h,(X,Y)\big)\Big]$$

compare to expected loss of best model in the class

Learning algorithm A maps datasets to models in a given class  ${\boldsymbol{\mathfrak H}}$ 

Variance error in statistical learning

$$\mathbb{E}\Big[\ell\big(A(S_{\mathsf{T}}),(X,Y)\big)\Big] - \inf_{h\in\mathcal{H}}\mathbb{E}\Big[\ell\big(h,(X,Y)\big)\Big]$$

compare to expected loss of best model in the class

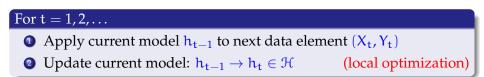

### Regret in online learning

$$\sum_{t=1}^{T} \ell \big( A(S_{t-1}), (X_t, Y_t) \big) - \inf_{h \in \mathcal{H}} \sum_{t=1}^{T} \ell \big( h, (X_t, Y_t) \big)$$

compare to cumulative loss of best model in the class

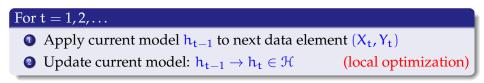

A natural blueprint for online learning algorithms

A natural blueprint for online learning algorithms

# Goal: control regret $\sum_{t=1}^{T} \ell (h_{t-1}, (X_t, Y_t)) - \inf_{h \in \mathcal{H}} \sum_{t=1}^{T} \ell (h, (X_t, Y_t))$

A natural blueprint for online learning algorithms

For 
$$t = 1, 2, ...$$
• Apply current model  $h_{t-1}$  to next data element  $(X_t, Y_t)$ • Update current model:  $h_{t-1} \rightarrow h_t \in \mathcal{H}$  (local optimization)

# Goal: control regret $\sum_{t=1}^{T} \ell (h_{t-1}, (X_t, Y_t)) - \inf_{h \in \mathcal{H}} \sum_{t=1}^{T} \ell (h, (X_t, Y_t))$

View this as a repeated game between a player generating predictors  $h_t \in \mathcal{H}$  and an opponent generating data  $(X_t, Y_t)$ 

### 1 My beautiful regret

### 2 A supposedly fun game I'll play again

3 The joy of convex

N. Cesa-Bianchi (UNIMI)

## Theory of repeated games

James Hannan (1922–2010)

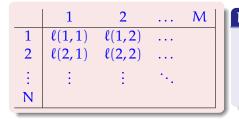

David Blackwell (1919–2010)

### Learning to play a game (1956)

Play a game repeatedly against a possibly suboptimal opponent

N. Cesa-Bianchi (UNIMI)

## Zero-sum 2-person games played more than once

### $N \times M$ known loss matrix

- Row player (player) has N actions
- Column player (opponent) has M actions

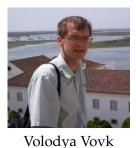

### For each game round t = 1, 2, ...

- Player chooses action it and opponent chooses action yt
- The player suffers loss  $l(i_t, y_t)$

(= gain of opponent)

Player can learn from opponent's history of past choices  $y_1, \ldots, y_{t-1}$ 

## Prediction with expert advice

	t = 1	t = 2	
1	$\ell_1(1)$	$\ell_2(1)$	
2	$\ell_1(2)$	$\ell_2(2)$	
÷	:	:	÷.,
Ν	$\ell_1(N)$	$\ell_2(N)$	

Manfred Warmuth

Opponent's moves  $y_1, y_2, ...$  define a sequential prediction problem with a time-varying loss function  $\ell(i_t, y_t) = \ell_t(i_t)$ 

## Playing the experts game

### A sequential decision problem

- N actions
- Unknown deterministic assignment of losses to actions  $\ell_t = (\ell_t(1), \dots, \ell_t(N)) \in [0, 1]^N$  for  $t = 1, 2, \dots$

For t = 1, 2, ...

## Playing the experts game

### A sequential decision problem

- N actions
- Unknown deterministic assignment of losses to actions  $\ell_t = (\ell_t(1), \dots, \ell_t(N)) \in [0, 1]^N$  for  $t = 1, 2, \dots$

### For t = 1, 2, ...

 $\hfill 0$  Player picks an action  $I_t$  (possibly using randomization) and incurs loss  $\ell_t(I_t)$ 

## Playing the experts game

### A sequential decision problem

- N actions
- Unknown deterministic assignment of losses to actions  $\ell_t = (\ell_t(1), \dots, \ell_t(N)) \in [0, 1]^N$  for  $t = 1, 2, \dots$

### For t = 1, 2, ...

- $\textcircled{\sc 0}$  Player picks an action  $I_t$  (possibly using randomization) and incurs loss  $\ell_t(I_t)$
- <sup>2</sup> Player gets feedback information:  $l_t(1), \ldots, l_t(N)$

## Regret analysis

### Regret

$$R_{\mathsf{T}} \stackrel{\text{def}}{=} \mathbb{E}\left[\sum_{\mathsf{t}=1}^{\mathsf{T}} \ell_{\mathsf{t}}(\mathsf{I}_{\mathsf{t}})\right] - \min_{\mathsf{i}=1,\ldots,\mathsf{N}} \sum_{\mathsf{t}=1}^{\mathsf{T}} \ell_{\mathsf{t}}(\mathsf{i}) \stackrel{\text{want}}{=} \mathsf{o}(\mathsf{T})$$

## **Regret** analysis

### Regret

$$R_{T} \stackrel{\text{def}}{=} \mathbb{E}\left[\sum_{t=1}^{T} \ell_{t}(I_{t})\right] - \min_{i=1,\dots,N} \sum_{t=1}^{T} \ell_{t}(i) \stackrel{\text{want}}{=} o(T)$$

### Lower bound using random losses

•  $\ell_t(\mathfrak{i}) \to L_t(\mathfrak{i}) \in \{0,1\}$  independent random coin flip

• For any player strategy

$$\mathbb{E}\left[\sum_{t=1}^{I} L_t(I_t)\right] =$$

 $\frac{1}{2}$ 

• Then the expected regret is

$$\mathbb{E}\left[\max_{i=1,\dots,N}\sum_{t=1}^{T}\left(\frac{1}{2}-L_{t}(i)\right)\right] = (1-o(1))\sqrt{\frac{T\ln N}{2}}$$

for  $N, T \rightarrow \infty$ 

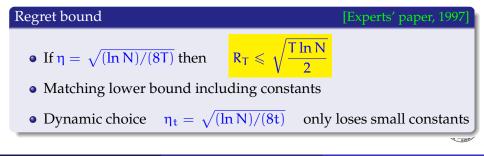

[Experts' paper, 1997]

## Exponentially weighted forecaster (Hedge)

At time t pick action  $I_t = i$  with probability proportional to

$$\exp\left(-\eta\sum_{s=1}^{t-1}\ell_s(\mathfrak{i})\right)$$

the sum at the exponent is the total loss of action i up to now

## $(?) \quad (?) \quad (?)$

## $(?) \quad (?) \quad (?)$

#### For t = 1, 2, ...

0 Player picks an action  $I_t$  (possibly using randomization) and incurs loss  $\ell_t(I_t)$ 

## $(?) \quad (3) \quad (?) \quad (?)$

#### For t = 1, 2, ...

- 0 Player picks an action  $I_t$  (possibly using randomization) and incurs loss  $\ell_t(I_t)$
- 2 Player gets partial information: Only  $\ell_t(I_t)$  is revealed

## $(?) \quad (3) \quad (?) \quad (?)$

#### For t = 1, 2, ...

- 0 Player picks an action  $I_t$  (possibly using randomization) and incurs loss  $\ell_t(I_t)$
- 2 Player gets partial information: Only  $l_t(I_t)$  is revealed

### Player still competing agaist best offline action

$$R_{T} = \mathbb{E}\left[\sum_{t=1}^{T} \ell_{t}(I_{t})\right] - \min_{i=1,\dots,N} \sum_{t=1}^{T} \ell_{t}(i)$$

## The Exp3 algorithm

[Auer et al., 2002]

### Hedge with estimated losses

• 
$$\mathbb{P}_{t}(I_{t} = i) \propto \exp\left(-\eta \sum_{s=1}^{t-1} \hat{\ell}_{s}(i)\right)$$
  $i = 1, ..., N$   
•  $\hat{\ell}_{t}(i) = \begin{cases} \frac{\ell_{t}(i)}{\mathbb{P}_{t}(\ell_{t}(i) \text{ observed})} & \text{if } I_{t} = i\\ 0 & \text{otherwise} \end{cases}$   
Only one non-zero component in  $\hat{\ell}_{t}$ 

C

## The Exp3 algorithm

### Hedge with estimated losses

• 
$$\mathbb{P}_{t}(I_{t} = i) \propto \exp\left(-\eta \sum_{s=1}^{t-1} \widehat{\ell}_{s}(i)\right)$$
  $i = 1, ..., N$   
•  $\widehat{\ell}_{t}(i) = \begin{cases} \frac{\ell_{t}(i)}{\mathbb{P}_{t}(\ell_{t}(i) \text{ observed})} & \text{if } I_{t} = i\\ 0 & \text{otherwise} \end{cases}$   
Only one non-zero component in  $\widehat{\ell}_{t}$ 

$$\begin{split} & \text{Properties of importance weighting estimator} \\ & \mathbb{E}_t \Big[ \widehat{\ell}_t(i) \Big] = \ell_t(i) & \text{unbiasedness} \\ & \mathbb{E}_t \Big[ \widehat{\ell}_t(i)^2 \Big] \leqslant \frac{1}{\mathbb{P}_t \big( \ell_t(i) \text{ observed} \big)} & \text{variance control} \end{split}$$

## Exp3 regret bound

$$\begin{split} \mathsf{R}_\mathsf{T} &\leqslant \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \, \mathbb{E} \left[ \sum_{t=1}^\mathsf{T} \sum_{i=1}^\mathsf{N} \mathbb{P}_t(\mathsf{I}_t = i) \mathbb{E}_t \Big[ \widehat{\ell}_t(i)^2 \Big] \right] \\ &\leqslant \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \, \mathbb{E} \left[ \sum_{t=1}^\mathsf{T} \sum_{i=1}^\mathsf{N} \frac{\mathbb{P}_t(\mathsf{I}_t = i)}{\mathbb{P}_t(\ell_t(i) \text{ is observed})} \right] \\ &= \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \mathsf{N} \mathsf{T} = \frac{\sqrt{\mathsf{N}\mathsf{T}\ln\mathsf{N}}}{\sqrt{\mathsf{N}\mathsf{T}\ln\mathsf{N}}} \quad \text{lower bound } \Omega(\sqrt{\mathsf{N}\mathsf{T}}) \end{split}$$

## Exp3 regret bound

$$\begin{split} \mathsf{R}_{\mathsf{T}} &\leqslant \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \, \mathbb{E} \left[ \sum_{t=1}^{\mathsf{T}} \sum_{i=1}^{\mathsf{N}} \mathbb{P}_{\mathsf{t}}(\mathsf{I}_t = \mathfrak{i}) \mathbb{E}_{\mathsf{t}} \left[ \widehat{\ell}_{\mathsf{t}}(\mathfrak{i})^2 \right] \right] \\ &\leqslant \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \, \mathbb{E} \left[ \sum_{t=1}^{\mathsf{T}} \sum_{i=1}^{\mathsf{N}} \frac{\mathbb{P}_{\mathsf{t}}(\mathsf{I}_t = \mathfrak{i})}{\mathbb{P}_{\mathsf{t}}(\ell_{\mathsf{t}}(\mathfrak{i}) \text{ is observed})} \right] \\ &= \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \mathsf{N} \mathsf{T} = \frac{\sqrt{\mathsf{NT} \ln \mathsf{N}}}{\sqrt{\mathsf{NT} \ln \mathsf{N}}} \quad \text{lower bound } \Omega(\sqrt{\mathsf{NT}}) \end{split}$$

Improved matching upper bound by [Audibért and Bubeck, 2009]

## Exp3 regret bound

$$\begin{split} \mathsf{R}_\mathsf{T} &\leqslant \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \, \mathbb{E} \bigg[ \sum_{t=1}^\mathsf{T} \sum_{i=1}^\mathsf{N} \mathbb{P}_t(\mathsf{I}_t = i) \mathbb{E}_t \Big[ \widehat{\ell}_t(i)^2 \Big] \bigg] \\ &\leqslant \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \, \mathbb{E} \bigg[ \sum_{t=1}^\mathsf{T} \sum_{i=1}^\mathsf{N} \frac{\mathbb{P}_t(\mathsf{I}_t = i)}{\mathbb{P}_t(\ell_t(i) \text{ is observed})} \bigg] \\ &= \frac{\ln \mathsf{N}}{\eta} + \frac{\eta}{2} \mathsf{N} \mathsf{T} = \frac{\sqrt{\mathsf{N} \mathsf{T} \ln \mathsf{N}}}{\sqrt{\mathsf{N} \mathsf{T} \ln \mathsf{N}}} \quad \text{lower bound } \Omega(\sqrt{\mathsf{N} \mathsf{T}}) \end{split}$$

Improved matching upper bound by [Audibért and Bubeck, 2009]

### The full information (experts) setting

- $\bullet\,$  Player observes vector of losses  $\boldsymbol{\ell}_t$  after each play
- $\mathbb{P}_t(\ell_t(i) \text{ is observed}) = 1$
- $R_T \leqslant \sqrt{T \ln N}$

### The adaptive adversary

• The loss of action i at time t depends on the player's past m actions  $\ell_t(i) \to \ell_t(I_{t-m},\ldots,I_{t-1},i)$ 

### The adaptive adversary

- The loss of action i at time t depends on the player's past m actions  $\ell_t(i) \rightarrow \ell_t(I_{t-m}, \dots, I_{t-1}, i)$
- Examples: bandits with switching cost

### The adaptive adversary

- The loss of action i at time t depends on the player's past m actions  $\ell_t(i) \rightarrow \ell_t(I_{t-m}, \dots, I_{t-1}, i)$
- Examples: bandits with switching cost

### Nonoblivious regret

$$R_T^{non} = \mathbb{E}\left[\sum_{t=1}^T \ell_t(I_{t-m}, \dots, I_{t-1}, \boldsymbol{I_t}) - \min_{i=1,\dots,N} \sum_{t=1}^T \ell_t(I_{t-m}, \dots, I_{t-1}, \boldsymbol{i})\right]$$

### The adaptive adversary

- The loss of action i at time t depends on the player's past m actions  $\ell_t(i) \rightarrow \ell_t(I_{t-m}, \dots, I_{t-1}, i)$
- Examples: bandits with switching cost

#### Nonoblivious regret

$$R_{T}^{non} = \mathbb{E}\left[\sum_{t=1}^{T} \ell_{t}(I_{t-m}, \dots, I_{t-1}, \boldsymbol{I_{t}}) - \min_{i=1,\dots,N} \sum_{t=1}^{T} \ell_{t}(I_{t-m}, \dots, I_{t-1}, \boldsymbol{i})\right]$$

Policy regret
$$R_{T}^{pol} = \mathbb{E}\left[\sum_{t=1}^{T} \ell_{t}(I_{t-m}, \dots, I_{t-1}, \mathbf{I}_{t}) - \min_{i=1,\dots,N} \sum_{t=1}^{T} \ell_{t}(\underbrace{i,\dots,i}_{m \text{ times}}, \mathbf{i})\right]$$

 $R_{\rm T}^{\rm non} = O\big(\sqrt{{\rm TN}\ln N}\big)$ 

- Exp3 with biased loss estimates
- Is the  $\sqrt{\ln N}$  factor necessary?

 $R_{T}^{non} = O(\sqrt{TN \ln N})$ 

Exp3 with biased loss estimates

• Is the  $\sqrt{\ln N}$  factor necessary?

Bounds on the policy regret for any constant  $m \ge 1$ 

$$\mathbf{R}_{\mathrm{T}}^{\mathrm{pol}} = \mathcal{O}\left((\mathrm{N}\ln\mathrm{N})^{1/3}\mathrm{T}^{2/3}\right)$$

- Achieved by a very simple player strategy
- Optimal up to log factors!

[Dekel, Koren, and Peres, 2014]

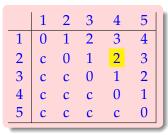

## Partial monitoring: not observing any loss

### Dynamic pricing: Perform as the best fixed price

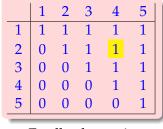

- Post a T-shirt price
- Observe if next customer buys or not
- Adjust price

Feedback does not reveal the player's loss

Loss matrix

#### Feedback matrix

### A characterization of minimax regret

Special case

Multiarmed bandits: loss and feedback matrix are the same

## A characterization of minimax regret

#### Special case

Multiarmed bandits: loss and feedback matrix are the same

#### A general gap theorem [Bartok, Foster, Pál, Rakhlin and Szepesvári, 2013]

- A constructive characterization of the minimax regret for any pair of loss/feedback matrix
- Only three possible rates for nontrivial games:
  - Easy games (e.g., bandits):  $\Theta(\sqrt{T})$
  - 2 Hard games (e.g., revealing action):  $\Theta(T^{2/3})$
  - 3 Impossible games:  $\Theta(\mathsf{T})$

## A game equivalent to prediction with expert advice

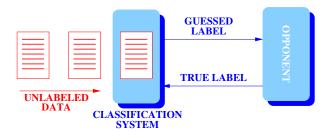

#### Online linear optimization in the simplex

- Play  $\mathbf{p}_t$  from the N-dimensional simplex  $\Delta_N$
- **2** Incur linear loss  $\mathbb{E}[\ell_t(I_t)] = \mathbf{p}_t^\top \ell_t$
- Observe loss gradient l<sub>t</sub>

#### Regret: compete against the best point in the simplex

$$\sum_{t=1}^{T} \mathbf{p}_{t}^{\top} \boldsymbol{\ell}_{t} - \underbrace{\min_{\mathbf{q} \in \Delta_{N}} \sum_{t=1}^{T} \mathbf{q}^{\top} \boldsymbol{\ell}_{t}}_{= \min_{i=1,\dots,N} \frac{1}{T} \sum_{t=1}^{T} \boldsymbol{\ell}_{t}(i)}$$

## From game theory to machine learning

- Opponent's moves  $y_t$  are viewed as values or labels assigned to observations  $x_t \in \mathbb{R}^d$  (e.g., categories of documents)
- A repeated game between the player choosing an element w<sub>t</sub> of a linear space and the opponent choosing a label y<sub>t</sub> for x<sub>t</sub>
- Regret with respect to best element in the linear space

### 1 My beautiful regret

### A supposedly fun game I'll play again

3 The joy of convex

N. Cesa-Bianchi (UNIMI)

### Online convex optimization

- Play w<sub>t</sub> from a convex and compact subset S of a linear space
- **2** Observe convex loss  $\ell_t : S \to \mathbb{R}$  and pay  $\ell_t(w_t)$
- **3** Update:  $w_t \rightarrow w_{t+1} \in S$

### Online convex optimization

- Play  $w_t$  from a convex and compact subset S of a linear space
- **2** Observe convex loss  $\ell_t : S \to \mathbb{R}$  and pay  $\ell_t(w_t)$
- **③** Update:  $w_t \rightarrow w_{t+1} \in S$

#### Example

- Regression with square loss:  $\ell_t(\boldsymbol{w}) = (\boldsymbol{w}^\top \boldsymbol{x}_t \boldsymbol{y}_t)^2 \quad \boldsymbol{y}_t \in \mathbb{R}$
- Classification with hinge loss:  $\ell_t(w) = [1 y_t w^\top x_t]_+ y_t \in \{-1, +1\}$

[Zinkevich, 2003]

### Online convex optimization

- Play  $w_t$  from a convex and compact subset S of a linear space
- **2** Observe convex loss  $l_t : S \to \mathbb{R}$  and pay  $l_t(w_t)$
- **③** Update:  $w_t \rightarrow w_{t+1} \in S$

#### Example

- Regression with square loss:  $\ell_t(\boldsymbol{w}) = (\boldsymbol{w}^\top \boldsymbol{x}_t \boldsymbol{y}_t)^2 \quad \boldsymbol{y}_t \in \mathbb{R}$
- Classification with hinge loss:  $\ell_t(w) = [1 y_t w^\top x_t]_+ y_t \in \{-1, +1\}$

#### Regret

$$R_{\mathsf{T}}(\mathfrak{u}) = \sum_{\mathsf{t}=1}^{\mathsf{T}} \ell_{\mathsf{t}}(\boldsymbol{w}_{\mathsf{t}}) - \sum_{\mathsf{t}=1}^{\mathsf{T}} \ell_{\mathsf{t}}(\mathfrak{u}) \qquad \mathsf{u} \in S$$

## Finding a good online algorithm

#### Follow the leader

$$w_{t+1} = \operatorname{arginf}_{w \in S} \sum_{s=1}^{t} \ell_s(w)$$

Regret can be linear due to lack of stability

$$S = [-1, +1] \qquad \ell_1(w) = \frac{w}{2} \qquad \ell_t(w) = \begin{cases} -w & \text{if t is even} \\ +w & \text{if t is odd} \end{cases}$$

## Finding a good online algorithm

#### Follow the leader

$$w_{t+1} = \operatorname{arginf}_{w \in S} \sum_{s=1}^{t} \ell_s(w)$$

Regret can be linear due to lack of stability

$$S = [-1, +1] \qquad \ell_1(w) = \frac{w}{2} \qquad \ell_t(w) = \begin{cases} -w & \text{if t is even} \\ +w & \text{if t is odd} \end{cases}$$

• Note: 
$$\sum_{s=1}^{t} \ell_s(w) = \begin{cases} -\frac{w}{2} & \text{if t is even} \\ +\frac{w}{2} & \text{if t is odd} \end{cases}$$
  
• Hence  $\ell_{t+1}(w_{t+1}) = 1$  for all  $t = 1, 2...$ 

## Follow the regularized leader

[Shalev-Shwartz, 2007; Abernethy, Hazan and Rakhlin, 2008]

$$w_{t+1} = \underset{w \in S}{\operatorname{argmin}} \left[ \eta \sum_{s=1}^{t} \ell_s(w) + \Phi(w) \right]$$

 $\Phi$  is a strongly convex regularizer and  $\eta > 0$  is a scale parameter

#### Strong convexity

 $\Phi: S \to \mathbb{R}$  is  $\beta$ -strongly convex w.r.t. a norm  $\|\cdot\|$  if for all  $\mathbf{u}, \mathbf{v} \in S$ 

$$\Phi(\mathbf{v}) \ge \Phi(\mathbf{u}) + \nabla \Phi(\mathbf{u})^{\top} (\mathbf{v} - \mathbf{u}) + \frac{\beta}{2} \|\mathbf{u} - \mathbf{v}\|^2$$

#### Strong convexity

 $\Phi$  :  $S \to \mathbb{R}$  is  $\beta$ -strongly convex w.r.t. a norm  $\|\cdot\|$  if for all  $\mathfrak{u}, \mathfrak{v} \in S$ 

$$\Phi(\mathbf{v}) \ge \Phi(\mathbf{u}) + \nabla \Phi(\mathbf{u})^{\top} (\mathbf{v} - \mathbf{u}) + \frac{\beta}{2} \|\mathbf{u} - \mathbf{v}\|^2$$

#### Smoothness

 $\Phi : S \to \mathbb{R}$  is  $\alpha$ -smooth w.r.t. a norm  $\|\cdot\|$  if for all  $\mathbf{u}, \mathbf{v} \in S$ 

$$\Phi(\mathbf{v}) \leqslant \Phi(\mathbf{u}) + \nabla \Phi(\mathbf{u})^{\top} (\mathbf{v} - \mathbf{u}) + \frac{\alpha}{2} \|\mathbf{u} - \mathbf{v}\|^2$$

#### Strong convexity

 $\Phi$  :  $S \to \mathbb{R}$  is  $\beta$ -strongly convex w.r.t. a norm  $\|\cdot\|$  if for all  $\mathfrak{u}, \mathfrak{v} \in S$ 

$$\Phi(\mathbf{v}) \ge \Phi(\mathbf{u}) + \nabla \Phi(\mathbf{u})^{\top}(\mathbf{v} - \mathbf{u}) + \frac{\beta}{2} \|\mathbf{u} - \mathbf{v}\|^2$$

#### Smoothness

 $\Phi: \mathbb{S} \to \mathbb{R}$  is  $\alpha$ -smooth w.r.t. a norm  $\|\cdot\|$  if for all  $\mathbf{u}, \mathbf{v} \in \mathbb{S}$ 

$$\Phi(\mathbf{v}) \leq \Phi(\mathbf{u}) + \nabla \Phi(\mathbf{u})^{\top} (\mathbf{v} - \mathbf{u}) + \frac{\alpha}{2} \|\mathbf{u} - \mathbf{v}\|^2$$

• If  $\Phi$  is  $\beta$ -strongly convex w.r.t.  $\|\cdot\|_2$ , then  $\nabla^2 \Phi \succeq \beta I$ 

• If  $\Phi$  is  $\alpha$ -smooth w.r.t.  $\|\cdot\|_2$ , then  $\nabla^2 \Phi \preceq \alpha I$ 

. BIST

# • Euclidean norm: $\Phi = \frac{1}{2} \| \cdot \|_2^2$ is 1-strongly convex w.r.t. $\| \cdot \|_2$

## Examples

• Euclidean norm:  $\Phi = \frac{1}{2} \| \cdot \|_2^2$  is 1-strongly convex w.r.t.  $\| \cdot \|_2$ 

• p-norm:  $\Phi = \frac{1}{2} \| \cdot \|_p^2$  is (p-1)-strongly convex w.r.t.  $\| \cdot \|_p$  (for 1 )

• Euclidean norm:  $\Phi = \frac{1}{2} \| \cdot \|_2^2$  is 1-strongly convex w.r.t.  $\| \cdot \|_2$ 

- p-norm:  $\Phi = \frac{1}{2} \| \cdot \|_p^2$  is (p-1)-strongly convex w.r.t.  $\| \cdot \|_p$  (for 1 )
- Entropy:  $\Phi(\mathbf{p}) = \sum_{i=1}^{d} p_i \ln p_i$  is 1-strongly convex w.r.t.  $\|\cdot\|_1$  (for **p** in the probability simplex)

• Euclidean norm:  $\Phi = \frac{1}{2} \| \cdot \|_2^2$  is 1-strongly convex w.r.t.  $\| \cdot \|_2$ 

- p-norm:  $\Phi = \frac{1}{2} \| \cdot \|_p^2$  is (p-1)-strongly convex w.r.t.  $\| \cdot \|_p$  (for 1 )
- Entropy:  $\Phi(\mathbf{p}) = \sum_{i=1}^{d} p_i \ln p_i$  is 1-strongly convex w.r.t.  $\|\cdot\|_1$  (for **p** in the probability simplex)
- Power norm:  $\Phi(w) = \frac{1}{2}w^{\top}Aw$  is 1-strongly convex w.r.t.  $\|w\| = \sqrt{w^{\top}Aw}$

(for A symmetric and positive definite)

## Convex duality

#### Definition

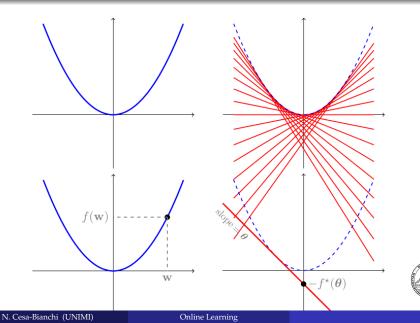

The convex dual of 
$$\Phi$$
 is  $\Phi^*(\theta) = \max_{w \in S} \left( \theta^\top w - \Phi(w) \right)$ 

#### 1-dimensional example

- Convex  $f : \mathbb{R} \to \mathbb{R}$  such that f(0) = 0
- $f^*(\theta) = \max_{w \in \mathbb{R}} (w \times \theta f(w))$
- The maximizer is  $w_0$  such that  $f'(w_0) = \theta$
- This gives  $f^*(\theta) = w_0 \times f'(w_0) f(w_0)$
- As f(0) = 0,  $f^*(\theta)$  is the error in approximating f(0) with a first-order expansion around  $f(w_0)$

### Convex duality

### Some useful properties

If  $\Phi : S \to \mathbb{R}$  is  $\beta$ -strongly convex w.r.t.  $\| \cdot \|$ , then

Its convex dual Φ\* is everywhere differentiable and <sup>1</sup>/<sub>β</sub>-smooth w.r.t. || · ||<sub>\*</sub> (the dual norm of || · ||)

```
• \nabla \Phi^*(\theta) = \underset{w \in S}{\operatorname{argmax}} \left( \theta^\top w - \Phi(w) \right)
```

### Some useful properties

If  $\Phi : S \to \mathbb{R}$  is  $\beta$ -strongly convex w.r.t.  $\| \cdot \|$ , then

Its convex dual Φ\* is everywhere differentiable and <sup>1</sup>/<sub>β</sub>-smooth w.r.t. || · ||<sub>\*</sub> (the dual norm of || · ||)

• 
$$\nabla \Phi^*(\theta) = \operatorname*{argmax}_{w \in S} \left( \theta^\top w - \Phi(w) \right)$$

Recall: Follow the regularized leader (FTRL)

$$w_{t+1} = \underset{w \in S}{\operatorname{argmin}} \left[ \eta \sum_{s=1}^{t} \ell_s(w) + \Phi(w) \right]$$

 $\Phi$  is a strongly convex regularizer and  $\eta>0$  is a scale parameter

## Using the loss gradient

Linearization of convex losses

$$\ell_{t}(\boldsymbol{w}_{t}) - \ell_{t}(\boldsymbol{u}) \leqslant \underbrace{\nabla \ell_{t}(\boldsymbol{w}_{t})}_{\widetilde{\ell}_{t}}^{\top} \boldsymbol{w}_{t} - \underbrace{\nabla \ell_{t}(\boldsymbol{w}_{t})}_{\widetilde{\ell}_{t}}^{\top} \boldsymbol{u}$$

#### FTRL with linearized losses

$$w_{t+1} = \underset{w \in S}{\operatorname{argmin}} \left( \underbrace{\eta \sum_{s=1}^{t} \widetilde{\ell}_{s}^{\top} w}_{-\theta_{t+1}} + \Phi(w) \right) = \underset{w \in S}{\operatorname{argmax}} \left( \theta_{t+1}^{\top} w - \Phi(w) \right)$$
$$= \nabla \Phi^{*}(\theta_{t+1})$$

Note:  $w_{t+1} \in S$  always holds

Constant of the second

### The Mirror Descent algorithm

Recall: 
$$\boldsymbol{w}_{t+1} = \nabla \Phi^* (\boldsymbol{\theta}_t) = \nabla \Phi^* \left( -\eta \sum_{s=1}^t \nabla \ell_s(\boldsymbol{w}_s) \right)$$

Online Mirror Descent (FTRL with linearized losses)

For t = 1, 2, ...

- Use  $w_t = \nabla \Phi^*(\theta_t)$  // dual parameter (via mirror step)
  - 2 Suffer loss  $\ell_t(w_t)$
- Observe loss gradient  $\nabla \ell_t(w_t)$
- Update  $\theta_{t+1} = \theta_t \eta \nabla \ell_t(w_t)$

// gradient step

## An equivalent formulation

Under some assumptions on the regularizer  $\Phi$ , OMD can be equivalently written in terms of projected gradient descent

#### Online Mirror Descent (alternative version)

**Parameters:** Strongly convex regularizer  $\Phi$  and learning rate  $\eta > 0$ **Initialize:**  $z_1 = \nabla \Phi^*(\mathbf{0})$  and  $w_1 = \underset{w \in S}{\operatorname{argmin}} D_{\Phi}(w || z_1)$ 

For t = 1, 2, ...

• Use  $w_t$  and suffer loss  $\ell_t(w_t)$ 

2 Observe loss gradient  $\nabla \ell_t(w_t)$ 

**9** Update 
$$z_{t+1} = \nabla \Phi^* \Big( \nabla \Phi(z_t) - \eta \nabla \ell_t(w_t) \Big)$$
 // gradient step
**9**  $w_{t+1} = \underset{w \in S}{\operatorname{argmin}} D_{\Phi} \Big( w \| z_{t+1} \Big)$  // projection step

## An equivalent formulation

Under some assumptions on the regularizer  $\Phi$ , OMD can be equivalently written in terms of projected gradient descent

#### Online Mirror Descent (alternative version)

**Parameters:** Strongly convex regularizer  $\Phi$  and learning rate  $\eta > 0$ **Initialize:**  $z_1 = \nabla \Phi^*(\mathbf{0})$  and  $w_1 = \underset{w \in S}{\operatorname{argmin}} D_{\Phi}(w || z_1)$

### $D_{\Phi}$ is the Bregman divergence induced by $\Phi$

### Some examples

### Some examples

### Online Gradient Descent (OGD)

#### [Zinkevich, 2003; Gentile, 2003]

[Kivinen and Warmuth, 1997]

$$\Phi(\boldsymbol{w}) = \frac{1}{2} \|\boldsymbol{w}\|^2$$
 p-norm version:  $\Phi(\boldsymbol{w}) = \frac{1}{2}$ 

• Update: 
$$w' = w_t - \eta \nabla \ell_t(w_t)$$

$$p\text{-norm version: } \Phi(w) = \frac{1}{2} \|w\|_{\mathfrak{p}}^{2}$$
$$w_{t+1} = \underset{w \in S}{\operatorname{arginf}} \|w - w'\|_{2}$$

#### Exponentiated gradient (EG)

• 
$$\Phi(\mathbf{p}) = \sum_{i=1}^{d} p_i \ln p_i$$
  
• 
$$p_{t+1,i} = \frac{p_{t,i}e^{-\eta \nabla \ell_t(\mathbf{p}_t)_i}}{\sum_{i=1}^{d} p_{t,i}e^{-\eta \nabla \ell_t(\mathbf{p}_t)_j}}$$

$$\mathbf{p} \in S \equiv \text{simplex}$$

Note: when losses are linear this is Hedge

-

## Regret analysis

Regret bound

#### [Kakade, Shalev-Shwartz and Tewari, 2012]

$$R_{\mathsf{T}}(\mathfrak{u}) \leqslant \frac{\Phi(\mathfrak{u}) - \min_{\mathfrak{w} \in S} \Phi(\mathfrak{w})}{\eta} + \frac{\eta}{2} \sum_{t=1}^{\mathsf{T}} \frac{\|\nabla \ell_t(\mathfrak{w}_t)\|_*^2}{\beta}$$

for all  $u \in S$ , where  $l_1, l_2, \ldots$  are arbitrary convex losses

- $\mathbb{R}_{\mathsf{T}}(\mathbf{u}) \leq \mathsf{GD}\sqrt{\mathsf{T}} \text{ for all } \mathbf{u} \in \mathsf{S}$  when  $\eta$  is tuned w.r.t.  $\sup_{w \in \mathsf{S}} \|\nabla \ell_{\mathsf{t}}(w)\|_{*} \leq \mathsf{G}$   $\sqrt{\sup_{\mathbf{u}, w \in \mathsf{S}} \left(\Phi(\mathbf{u}) - \Phi(w)\right)} \leq \mathsf{D}$ • Boundedness of gradients of  $\ell_{\mathsf{t}}$  w.r.t.  $\|\mathbf{u}\|_{*}$  equivalent to
- Boundedness of gradients of  $\ell_t$  w.r.t.  $\|\cdot\|_*$  equivalent to Lipschitzess of  $\ell_t$  w.r.t.  $\|\cdot\|$
- Regret bound optimal for general convex losses  $l_t$

## Analysis relies on smoothness of $\Phi^*$

$$\Phi^{*}(\boldsymbol{\theta}_{t+1}) - \Phi^{*}(\boldsymbol{\theta}_{t}) \leq \underbrace{\nabla \Phi^{*}(\boldsymbol{\theta}_{t})}_{\boldsymbol{w}_{t}}^{\top} \left( \underbrace{\boldsymbol{\theta}_{t+1} - \boldsymbol{\theta}_{t}}_{-\eta \nabla \ell_{t}(\boldsymbol{w}_{t})} \right) + \frac{1}{2\beta} \left\| \boldsymbol{\theta}_{t+1} - \boldsymbol{\theta}_{t} \right\|_{*}^{2}$$

# Analysis relies on smoothness of $\Phi^*$

$$\begin{split} \Phi^*(\boldsymbol{\theta}_{t+1}) - \Phi^*(\boldsymbol{\theta}_t) &\leq \underbrace{\nabla \Phi^*(\boldsymbol{\theta}_t)}_{\boldsymbol{w}_t}^\top \left( \underbrace{\boldsymbol{\theta}_{t+1} - \boldsymbol{\theta}_t}_{-\eta \nabla \ell_t(\boldsymbol{w}_t)} \right) + \frac{1}{2\beta} \left\| \boldsymbol{\theta}_{t+1} - \boldsymbol{\theta}_t \right\|_*^2 \\ &\sum_{t=1}^T - \eta \mathbf{u}^\top \nabla \ell_t(\boldsymbol{w}_t) - \Phi(\mathbf{u}) = \mathbf{u}^\top \boldsymbol{\theta}_{T+1} - \Phi(\mathbf{u}) \\ &\leq \Phi^*(\boldsymbol{\theta}_{T+1}) \quad \text{Fenchel-Young inequality} \end{split}$$

$$= \sum_{t=1}^{T} \left( \Phi^*(\boldsymbol{\theta}_{t+1}) - \Phi^*(\boldsymbol{\theta}_{t}) \right) + \Phi^*(\boldsymbol{\theta}_{1})$$
  
$$\leq \sum_{t=1}^{T} \left( -\eta \boldsymbol{w}_t^\top \nabla \ell_t(\boldsymbol{w}_t) + \frac{\eta^2}{2\beta} \left\| \nabla \ell_t(\boldsymbol{w}_t) \right\|_*^2 \right) + \Phi^*(\boldsymbol{0})$$

# Analysis relies on smoothness of $\Phi^*$

$$\begin{split} \Phi^*(\boldsymbol{\theta}_{t+1}) - \Phi^*(\boldsymbol{\theta}_t) &\leqslant \underbrace{\nabla \Phi^*(\boldsymbol{\theta}_t)}_{\boldsymbol{w}_t}^\top \left( \underbrace{\boldsymbol{\theta}_{t+1} - \boldsymbol{\theta}_t}_{-\eta \nabla \ell_t(\boldsymbol{w}_t)} \right) + \frac{1}{2\beta} \left\| \boldsymbol{\theta}_{t+1} - \boldsymbol{\theta}_t \right\|_*^2 \\ &\sum_{t=1}^T - \eta \mathbf{u}^\top \nabla \ell_t(\boldsymbol{w}_t) - \Phi(\mathbf{u}) = \mathbf{u}^\top \boldsymbol{\theta}_{T+1} - \Phi(\mathbf{u}) \\ &\leqslant \Phi^*(\boldsymbol{\theta}_{T+1}) \quad \text{Fenchel-Young inequality} \\ &= \sum_{t=1}^T \left( \Phi^*(\boldsymbol{\theta}_{t+1}) - \Phi^*(\boldsymbol{\theta}_t) \right) + \Phi^*(\boldsymbol{\theta}_1) \\ &\leqslant \sum_{t=1}^T \left( -\eta \boldsymbol{w}_t^\top \nabla \ell_t(\boldsymbol{w}_t) + \frac{\eta^2}{2\beta} \left\| \nabla \ell_t(\boldsymbol{w}_t) \right\|_*^2 \right) + \Phi^*(\mathbf{0}) \end{split}$$

 $\Phi^*(\mathbf{0}) = \max_{\boldsymbol{w} \in S} \left( \boldsymbol{w}^\top \mathbf{0} - \Phi(\boldsymbol{w}) \right) = -\min_{\boldsymbol{w} \in S} \Phi(\boldsymbol{w})$ 

### Some examples

# $\ell_{t}(\boldsymbol{w}) \rightarrow \ell_{t}\left(\boldsymbol{w}^{\top}\boldsymbol{x}_{t}\right) \qquad \max_{t} |\ell_{t}'| \leqslant L \qquad \max_{t} \left\|\boldsymbol{x}_{t}\right\|_{p} \leqslant X_{p}$

 $\ell_{t}(\boldsymbol{w}) \rightarrow \ell_{t}\left(\boldsymbol{w}^{\top}\boldsymbol{x}_{t}\right) \qquad \max_{t} \left|\ell_{t}'\right| \leqslant L \qquad \max_{t} \left\|\boldsymbol{x}_{t}\right\|_{p} \leqslant X_{p}$ 

Bounds for OGD with convex losses

 $R_T(u) \leqslant BLX_2 \sqrt{T} = \mathbb{O} \big( dL \sqrt{T} \big)$ 

for all **u** such that  $||\mathbf{u}||_2 \leq B$ 

 $\ell_{t}(\boldsymbol{w}) \rightarrow \ell_{t}\left(\boldsymbol{w}^{\top}\boldsymbol{x}_{t}\right) \qquad \max_{t} |\ell_{t}'| \leqslant L \qquad \max_{t} \left\|\boldsymbol{x}_{t}\right\|_{p} \leqslant X_{p}$ 

Bounds for OGD with convex losses

 $R_{T}(u) \leqslant BLX_{2}\sqrt{T} = O\left(dL\sqrt{T}\right)$ 

for all **u** such that  $||\mathbf{u}||_2 \leq B$ 

Bounds logarithmic in the dimension

- Regret bound for EG run in the simplex,  $S = \Delta_d$  $R_T(q) \leq LX_{\infty} \sqrt{(\ln d)T} = O(L\sqrt{(\ln d)T})$   $p \in \Delta_d$
- Same bound for p-norm regularizer with  $p = \frac{\ln d}{\ln d 1}$
- If losses are linear with [0, 1] coefficients then we recover the bound for Hedge

# Exploiting curvature: minimization of SVM objective

- Training set  $(\mathbf{x}_1, \mathbf{y}_1), \dots, (\mathbf{x}_m, \mathbf{y}_m) \in \mathbb{R}^d \times \{-1, +1\}$
- SVM objective  $F(w) = \frac{1}{m} \sum_{t=1}^{m} \underbrace{\left[1 y_t w^\top x_t\right]_+}_{\text{hinge loss } h_t(w)} + \frac{\lambda}{2} \|w\|^2 \text{ over } \mathbb{R}^d$

• Rewrite 
$$F(w) = \frac{1}{m} \sum_{t=1}^{m} \ell_t(w)$$

where 
$$\ell_t(w) = h_t(w) + \frac{\lambda}{2} \|w\|^2$$

• Each loss  $\ell_t$  is  $\lambda$ -strongly convex

# Exploiting curvature: minimization of SVM objective

- Training set  $(\mathbf{x}_1, \mathbf{y}_1), \dots, (\mathbf{x}_m, \mathbf{y}_m) \in \mathbb{R}^d \times \{-1, +1\}$
- SVM objective  $F(w) = \frac{1}{m} \sum_{t=1}^{m} \underbrace{\left[1 y_t w^\top x_t\right]_+}_{\text{hinge loss } h_t(w)} + \frac{\lambda}{2} \|w\|^2 \text{ over } \mathbb{R}^d$

• Rewrite 
$$F(w) = \frac{1}{m} \sum_{t=1}^{m} \ell_t(w)$$

where 
$$\ell_{t}(\boldsymbol{w}) = h_{t}(\boldsymbol{w}) + \frac{\lambda}{2} \|\boldsymbol{w}\|^{2}$$

• Each loss  $\ell_t$  is  $\lambda$ -strongly convex

### The Pegasos algorithm

• Run OGD on random sequence of T training examples

• 
$$\mathbb{E}\left[F\left(\frac{1}{\mathsf{T}}\sum_{t=1}^{\mathsf{T}}\boldsymbol{w}_{t}\right)\right] \leq \min_{\boldsymbol{w}\in\mathbb{R}^{d}}F(\boldsymbol{w}) + \frac{\mathsf{G}^{2}}{2\lambda}\frac{\ln\mathsf{T}+1}{\mathsf{T}}$$

•  $O(\ln T)$  rates hold for any sequence of strongly convex losses

### Exp-concavity (strong convexity along the gradient direction)

- A convex  $\ell : S \to \mathbb{R}$  is  $\alpha$ -exp-concave when  $g(w) = e^{-\alpha \ell(w)}$  is concave
- For twice-differentiable losses:  $\nabla^2 \ell(w) \succeq \alpha \nabla \ell(w) \nabla \ell(w)^\top$  for all  $w \in S$
- $l_t(w) = -\ln(w^T x_t)$  is exp-concave

## **Online Newton Step**

• Update:  $w' = A_t^{-1} \nabla \ell_t(w_t)$   $w_{t+1} = \underset{w \in S}{\operatorname{argmin}} ||w - w'||_{A_t}$ • Where  $A_t = \varepsilon I + \sum_{s=1}^t \nabla \ell_s(w_s) \nabla \ell_s(w_s)^\top$ Note: Not an instance of OMD

# **Online Newton Step**

• Update:  $w' = A_t^{-1} \nabla \ell_t(w_t)$   $w_{t+1} = \underset{w \in S}{\operatorname{argmin}} \|w - w'\|_{A_t}$ • Where  $A_t = \varepsilon I + \sum_{s=1}^t \nabla \ell_s(w_s) \nabla \ell_s(w_s)^\top$ Note: Not an instance of OMD

Logarithmic regret bound for exp-concave losses

$$R_{T}(\mathbf{u}) \leq 5d\left(\frac{1}{\alpha} + GD\right) \ln(T+1) \qquad \mathbf{u} \in S$$

# **Online Newton Step**

• Update:  $w' = A_t^{-1} \nabla \ell_t(w_t)$   $w_{t+1} = \underset{w \in S}{\operatorname{argmin}} \|w - w'\|_{A_t}$ • Where  $A_t = \varepsilon I + \sum_{s=1}^t \nabla \ell_s(w_s) \nabla \ell_s(w_s)^\top$ Note: Not an instance of OMD

Logarithmic regret bound for exp-concave losses

$$R_{\mathsf{T}}(\mathfrak{u}) \leqslant 5d\left(\frac{1}{\alpha} + \mathsf{GD}\right)\ln(\mathsf{T}+1) \qquad \mathfrak{u} \in \mathsf{S}$$

Extension of ONS to convex losses [Luo, Agarwal, C-B, Langford, 2016]

$$\ell_t(\boldsymbol{w}) \to \ell_t\big(\boldsymbol{w}^\top \boldsymbol{x}_t\big) \qquad \max_t |\ell_t'| \leqslant L$$

 $R_{\mathsf{T}}(\mathfrak{u}) \leqslant \widetilde{\mathbb{O}}\big(\mathsf{CL}\,\sqrt{\mathsf{dT}}\big) \quad \text{for all } \mathfrak{u} \text{ s.t. } \left|\mathfrak{u}^{\top} \mathbf{x}_{\mathsf{t}}\right| \leqslant \mathsf{C}$ 

Invariance to linear transformations of the data

N. Cesa-Bianchi (UNIMI)

# Online Ridge Regression [Vovk, 2001; Azoury and Warmuth, 2001]

Logarithmic regret for square loss

$$\ell_{t}(\mathbf{u}) = \left(\mathbf{u}^{\mathsf{T}}\mathbf{x}_{t} - \mathbf{y}_{t}\right)^{2} \qquad \mathbf{Y} = \max_{t=1,\dots,T} |\mathbf{y}_{t}| \qquad \mathbf{X} = \max_{t=1,\dots,T} \|\mathbf{x}_{t}\|$$

• OMD with adaptive regularizer  $\Phi_t(w) = \frac{1}{2} \|w\|_{A_t}^2$ 

• Where 
$$A_t = I + \sum_{s=1}^t x_s x_s^{\top}$$
 and  $\theta_t = \sum_{s=1}^t -y_s x_s$ 

• Regret bound (oracle inequality)  

$$\sum_{t=1}^{T} \ell_t(\boldsymbol{w}_t) \leq \inf_{\boldsymbol{u} \in \mathbb{R}^d} \left( \sum_{t=1}^{T} \ell_t(\boldsymbol{u}) + \|\boldsymbol{u}\|^2 \right) + dY^2 \ln\left(1 + \frac{TX^2}{d}\right)$$

### Parameterless

• Scale-free: unbounded comparison set

# Scale free algorithm for convex losses [Orabona and Pál, 2015]

### Scale free algorithm for convex losses

• OMD with adaptive regularizer

$$\Phi_{\mathbf{t}}(\boldsymbol{w}) = \Phi_{0}(\boldsymbol{w}) \sqrt{\sum_{s=1}^{\mathbf{t}-1} \| 
abla \ell_{s}(\boldsymbol{w}_{s}) \|_{*}^{2}}$$

- $\Phi_0$  is a  $\beta$ -strongly convex base regularizer
- Regret bound (oracle inequality) for convex loss functions  $\ell_t$

$$\sum_{t=1}^{T} \ell_t(\boldsymbol{w}_t) \leqslant \inf_{\boldsymbol{u} \in \mathbb{R}^d} \sum_{t=1}^{T} \ell_t(\boldsymbol{u}) + \left(\Phi_0(\boldsymbol{u}) + \frac{1}{\beta} + \max_t \left\|\nabla \ell_t(\boldsymbol{w}_t)\right\|_*\right) \sqrt{T}$$

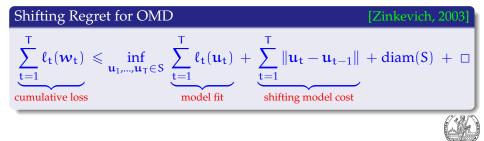

$$\boldsymbol{w}_{t+1} = \mathbb{E}_{\boldsymbol{Z}} \left[ \operatorname{argmin}_{\boldsymbol{w} \in S} \sum_{s=1}^{t} \left( \eta \nabla \ell_{s}(\boldsymbol{w}_{s}) + \boldsymbol{Z} \right)^{\mathsf{T}} \boldsymbol{w} \right]$$

- The distribution of Z must be "stable" (small variance and small average sensitivity)
- Regret bound similar to FTRL/OMD
- For some choices of Z, FPL becomes equivalent to OMD [Abernethy, Lee, Sinha and Tewari, 2014]
- Linear losses: Follow the Perturbed Leader algorithm [Kalai and Vempala, 2005]

### Nonstationarity

- If data source is not fitted well by any model in the class, then comparing to the best model  $u \in S$  is trivial
- Compare instead to the best sequence  $\mathbf{u}_1, \mathbf{u}_2, \dots \in S$  of models

# Strongly adaptive regret

### Definition

For all intervals  $I = \{r, \dots, s\}$  with  $1 \le r < s \le T$ 

$$R_{\mathsf{T},\mathrm{I}}(\mathfrak{u}) = \sum_{\mathsf{t}\in\mathrm{I}} \ell_{\mathsf{t}}(\mathfrak{w}_{\mathsf{t}}) - \sum_{\mathsf{t}\in\mathrm{I}} \ell_{\mathsf{t}}(\mathfrak{u})$$

#### Definition

For all intervals  $I = \{r, ..., s\}$  with  $1 \le r < s \le T$ 

$$R_{\mathsf{T},\mathsf{I}}(\mathfrak{u}) = \sum_{\mathsf{t}\in\mathsf{I}} \ell_{\mathsf{t}}(\boldsymbol{w}_{\mathsf{t}}) - \sum_{\mathsf{t}\in\mathsf{I}} \ell_{\mathsf{t}}(\mathfrak{u})$$

### Regret bound for strongly adaptive OGD

 $R_{T,I}(\mathbf{u}) \leq (BLX_2 + \ln(T+1))\sqrt{|I|}$  for all  $\mathbf{u}$  such that  $\|\mathbf{u}\|_2 \leq B$ 

#### Definition

For all intervals  $I = \{r, ..., s\}$  with  $1 \le r < s \le T$ 

$$R_{\mathsf{T},\mathsf{I}}(\mathsf{u}) = \sum_{\mathsf{t}\in\mathsf{I}} \ell_{\mathsf{t}}(w_{\mathsf{t}}) - \sum_{\mathsf{t}\in\mathsf{I}} \ell_{\mathsf{t}}(\mathsf{u})$$

### Regret bound for strongly adaptive OGD

 $R_{\mathsf{T},I}(\mathfrak{u}) \leqslant \left(\mathsf{BLX}_2 + \ln(\mathsf{T}+1)\right) \sqrt{|I|} \qquad \text{for all } \mathfrak{u} \text{ such that } \|\mathfrak{u}\|_2 \leqslant \mathsf{B}$ 

### Remarks

- Generic black-box reduction applicable to any online learning algorithm
- It runs a logarithmic number of instances of the base learner

- Play  $w_t$  from a convex and compact subset S of a linear space
- ② Observe  $\ell_t(w_t)$ , where  $\ell: S \to \mathbb{R}$  is unobserved convex loss
- **3** Update:  $w_t \rightarrow w_{t+1} \in S$

Regret: 
$$R_T(\mathbf{u}) = \sum_{t=1}^T \ell_t(\mathbf{w}_t) - \sum_{t=1}^T \ell_t(\mathbf{u}) \qquad \mathbf{u} \in S$$

- Play  $w_t$  from a convex and compact subset S of a linear space
- **2** Observe  $\ell_t(w_t)$ , where  $\ell: S \to \mathbb{R}$  is unobserved convex loss
- **3** Update:  $w_t \rightarrow w_{t+1} \in S$

Regret: 
$$R_T(\mathbf{u}) = \sum_{t=1}^T \ell_t(\mathbf{w}_t) - \sum_{t=1}^T \ell_t(\mathbf{u}) \qquad \mathbf{u} \in S$$

#### Results

• Linear losses:  $\Omega(d\sqrt{T})$ 

[Dani, Hayes, and Kakade, 2008]

- If  $w_t$  from a convex and compact subset S of a linear space
- Observe  $\ell_t(w_t)$ , where  $\ell: S \to \mathbb{R}$  is unobserved convex loss
- **3** Update:  $w_t \rightarrow w_{t+1} \in S$

Regret: 
$$R_T(\mathbf{u}) = \sum_{t=1}^T \ell_t(w_t) - \sum_{t=1}^T \ell_t(\mathbf{u}) \qquad \mathbf{u} \in S$$

#### Results

- Linear losses:  $\Omega(d\sqrt{T})$
- Linear losses:  $\tilde{O}(d\sqrt{T})$

[Dani, Hayes, and Kakade, 2008] [Bubeck, C-B, and Kakade, 2012]

- If  $w_t$  from a convex and compact subset S of a linear space
- **2** Observe  $\ell_t(w_t)$ , where  $\ell: S \to \mathbb{R}$  is unobserved convex loss
- **3** Update:  $w_t \rightarrow w_{t+1} \in S$

Regret:
